Context-Free Grammars

A **CFG** grammar G is denoted by

- a finite set of **nonterminal** symbols \mathcal{V}
- a finite set of **terminal** symbols Σ with $\Sigma \cap \mathcal{V} = \emptyset$
- a finite set \mathcal{R} of **rules** of the form $X \rightarrow \beta$ where
 - $X \in \mathcal{V}$ and $\beta \in (\Sigma \cup \mathcal{V})^*$
- $S \in \mathcal{V}$ a distinguished **start** symbol

Let ε denote an **empty** string

Example CFG

$S \rightarrow NP VP$

$Vi \rightarrow \text{sleeps}$

$VP \rightarrow Vi$

$Vt \rightarrow \text{saw}$

$VP \rightarrow Vt NP$

$NN \rightarrow \text{man}$

$VP \rightarrow VP PP$

$NN \rightarrow \text{dog}$

$NP \rightarrow DT NN$

$NN \rightarrow \text{telescope}$

$NP \rightarrow NP PP$

$DT \rightarrow \text{the}$

$PP \rightarrow IN NP$

$IN \rightarrow \text{with}$

Generative Device

Left-most derivation

- sequence of strings $a_1 \dots a_n$
 - $a_1 = \langle S \rangle$
 - $a_n \in \Sigma^*$
 - $a_{i \geq 2}$ derived from a_{i-1} by picking the left-most nonterminal X
 - and replacing it by some α such that $X \rightarrow \beta \in \mathcal{R}$

Example of Derivation

Example of Derivation

String

Substitution

Example of Derivation

	String	Substitution
$\alpha_1 =$	S	$S \rightarrow NP VP$

Example of Derivation

	String	Substitution
$\alpha_1 =$	S	$S \rightarrow NP VP$
$\alpha_2 =$	NP VP	$NP \rightarrow DT NN$

Example of Derivation

	String	Substitution
$\alpha_1 =$	S	$S \rightarrow NP VP$
$\alpha_2 =$	NP VP	$NP \rightarrow DT NN$
$\alpha_3 =$	DT NN VP	$DT \rightarrow \text{the}$

Example of Derivation

	String	Substitution
$\alpha_1 =$	S	$S \rightarrow NP VP$
$\alpha_2 =$	NP VP	$NP \rightarrow DT NN$
$\alpha_3 =$	DT NN VP	$DT \rightarrow \text{the}$
$\alpha_4 =$	the NN VP	$NN \rightarrow \text{man}$

Example of Derivation

	String	Substitution
$\alpha_1 =$	S	$S \rightarrow NP VP$
$\alpha_2 =$	NP VP	$NP \rightarrow DT NN$
$\alpha_3 =$	DT NN VP	$DT \rightarrow \text{the}$
$\alpha_4 =$	the NN VP	$NN \rightarrow \text{man}$
$\alpha_5 =$	the man VP	$VP \rightarrow V_i$

Example of Derivation

	String	Substitution
$\alpha_1 =$	S	$S \rightarrow NP VP$
$\alpha_2 =$	NP VP	$NP \rightarrow DT NN$
$\alpha_3 =$	DT NN VP	$DT \rightarrow the$
$\alpha_4 =$	the NN VP	$NN \rightarrow man$
$\alpha_5 =$	the man VP	$VP \rightarrow Vi$
$\alpha_6 =$	the man Vi	$Vi \rightarrow sleeps$

Example of Derivation

	String	Substitution
$\alpha_1 =$	S	$S \rightarrow NP VP$
$\alpha_2 =$	NP VP	$NP \rightarrow DT NN$
$\alpha_3 =$	DT NN VP	$DT \rightarrow \text{the}$
$\alpha_4 =$	the NN VP	$NN \rightarrow \text{man}$
$\alpha_5 =$	the man VP	$VP \rightarrow Vi$
$\alpha_6 =$	the man Vi	$Vi \rightarrow \text{sleeps}$
$\alpha_7 =$	the man sleeps	

Example of Derivation

	String	Substitution
$\alpha_1 =$	S	$S \rightarrow NP VP$
$\alpha_2 =$	NP VP	$NP \rightarrow DT NN$
$\alpha_3 =$	DT NN VP	$DT \rightarrow \text{the}$
$\alpha_4 =$	the NN VP	$NN \rightarrow \text{man}$
$\alpha_5 =$	the man VP	$VP \rightarrow V_i$
$\alpha_6 =$	the man V_i	$V_i \rightarrow \text{sleeps}$
$\alpha_7 =$	the man sleeps	
$\alpha_7 =$	$S \Rightarrow^* \text{the man sleeps}$

Language

A string $\omega \in \Sigma^*$ is generated/accepted by G if

$$S \Rightarrow^* \omega$$

\Rightarrow^* denotes a sequence of rule applications

Language of G

$$L(G) = \{\omega: S \Rightarrow^* \omega\} \subseteq \Sigma^*$$

Chomsky Normal Form

Every CFG is weakly equivalent to another such that

- $X \rightarrow YZ$ where $X, Y, Z \in \mathcal{V}$
- $X \rightarrow w$ where $w \in \Sigma$
- and possibly $S \rightarrow \varepsilon$

[Hopcroft and Ullman, 1979]

Parsing as Deduction

Parsing as Deduction

Deductive process to prove claims about grammaticality
[Shieber et al., 1995]

Parsing as Deduction

Deductive process to prove claims about grammaticality
[Shieber et al., 1995]

- focus on strategy rather than implementation

Parsing as Deduction

Deductive process to prove claims about grammaticality
[Shieber et al., 1995]

- focus on strategy rather than implementation
- soundness/completeness easier to prove

Parsing as Deduction

Deductive process to prove claims about grammaticality
[Shieber et al., 1995]

- focus on strategy rather than implementation
- soundness/completeness easier to prove
- complexity determined by inspection

Parsing as Deduction

Deductive process to prove claims about grammaticality
[Shieber et al., 1995]

- focus on strategy rather than implementation
- soundness/completeness easier to prove
- complexity determined by inspection
- dynamic program follows directly

Parsing as Deduction

Deductive process to prove claims about grammaticality
[Shieber et al., 1995]

- focus on strategy rather than implementation
- soundness/completeness easier to prove
- complexity determined by inspection
- dynamic program follows directly
- generality

Deductive systems

Item: a statement / intermediate sound result

- formula or schemata expressed with variables

Inference rule: statement derived from existing items

- $\frac{A_1 \dots A_m}{B}$ (condition) where A_i and B are items
 - A_i are called antecedents
 - B is called consequent

Deductive program

Axioms: trivial items

- do not depend on previous statements

Goal: states that a proof exists

Proof:

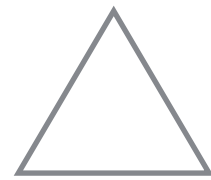

- start from axioms
- exhaustively deduce items
 - never twice under the same premises
- accept if goal is proven

"Dotted items"

"Dotted items"

Parsing a CNF grammar is easy because we know the shape of rules

"Dotted items"

Parsing a CNF grammar is easy because we know the shape of rules

When that's not the case, we have to **scan rules symbol by symbol** using a general mechanism:

"Dotted items"

Parsing a CNF grammar is easy because we know the shape of rules

When that's not the case, we have to **scan rules symbol by symbol** using a general mechanism:

Item form: $[i, X \rightarrow \alpha \blacksquare \bullet \beta \square, j]$ where $X \rightarrow \alpha \beta \in \mathcal{R}$ is a rule

"Dotted items"

Parsing a CNF grammar is easy because we know the shape of rules

When that's not the case, we have to **scan rules symbol by symbol** using a general mechanism:

Item form: $[i, X \rightarrow \alpha \blacksquare \bullet \beta \square, j]$ where $X \rightarrow \alpha \beta \in \mathcal{R}$ is a rule

- In general, we segment rules with respect to the input $x_1 \dots x_n$

"Dotted items"

Parsing a CNF grammar is easy because we know the shape of rules

When that's not the case, we have to **scan rules symbol by symbol** using a general mechanism:

Item form: $[i, X \rightarrow \alpha \blacksquare \bullet \beta \square, j]$ where $X \rightarrow \alpha \beta \in \mathcal{R}$ is a rule

- In general, we segment rules with respect to the input $x_1 \dots x_n$
- The dot represents progress through the rule's right-hand side (RHS)

"Dotted items"

Parsing a CNF grammar is easy because we know the shape of rules

When that's not the case, we have to **scan rules symbol by symbol** using a general mechanism:

Item form: $[i, X \rightarrow \alpha \blacksquare \bullet \beta \square, j]$ where $X \rightarrow \alpha \beta \in \mathcal{R}$ is a rule

- In general, we segment rules with respect to the input $x_1 \dots x_n$
- The dot represents progress through the rule's right-hand side (RHS)
- The prefix α has already been parsed and we are waiting for β

"Dotted items"

Parsing a CNF grammar is easy because we know the shape of rules

When that's not the case, we have to **scan rules symbol by symbol** using a general mechanism:

Item form: $[i, X \rightarrow \alpha \blacksquare \bullet \beta \square, j]$ where $X \rightarrow \alpha \beta \in \mathcal{R}$ is a rule

- In general, we segment rules with respect to the input $x_1 \dots x_n$
- The dot represents progress through the rule's right-hand side (RHS)
- The prefix α has already been parsed and we are waiting for β
- The filled box represents a segmentation of $[0 .. j]$ into $|\alpha|$ adjacent parts

"Dotted items"

Parsing a CNF grammar is easy because we know the shape of rules

When that's not the case, we have to **scan rules symbol by symbol** using a general mechanism:

Item form: $[i, X \rightarrow \alpha \blacksquare \bullet \beta \square, j]$ where $X \rightarrow \alpha \beta \in \mathcal{R}$ is a rule

- In general, we segment rules with respect to the input $x_1 \dots x_n$
- The dot represents progress through the rule's right-hand side (RHS)
- The prefix α has already been parsed and we are waiting for β
- The filled box represents a segmentation of $[0 .. j]$ into $|\alpha|$ adjacent parts
- The empty box has no actual role, it's just a reminder that the segmentation beyond j is unknown

Earley Parser

Input: G and $s = x_1 \dots x_n$

Item form: $[i, X \rightarrow \alpha \blacksquare \bullet \beta \square, j]$

asserts that $X \Rightarrow^* x_{i+1} \dots x_j \beta$

Axioms: $[0, S \rightarrow \bullet \alpha \square, 0] \quad S \rightarrow \alpha \in \mathcal{R}$

Goal: $[0, S \rightarrow \alpha \blacksquare \bullet, n]$

Scan

Predict

$$\frac{[i, X \rightarrow \alpha \blacksquare \bullet x_{j+1} \beta \square, j]}{[i, X \rightarrow \alpha \blacksquare x_{j+1} \bullet \beta \square, j+1]}$$

$$\frac{[i, X \rightarrow \alpha \blacksquare \bullet Y \beta \square]}{[i, Y \rightarrow \bullet \gamma, i]} \quad Y \rightarrow \gamma \in \mathcal{R}$$

Complete

$$\frac{[i, X \rightarrow \alpha \blacksquare \bullet Y \beta \square, k][k, Y \rightarrow \gamma \blacksquare \bullet, j]}{[i, X \rightarrow \alpha \blacksquare Y_{k,j} \bullet \beta \square, j]}$$

Goal: [16]				

Correctness of Parsing Strategy

Soundness: if a goal item is proven for α

- then $\omega \in L(G)$

Completeness: if $\alpha \in L(G)$

- then a goal item can be proven for α

Parse Forest

Efficient representation of the whole space $T_G(\omega)$

- each and every possible tree yielding ω

We must be able to represent partial derivations

- including alternative ones

Ambiguity

Some strings may have more than one derivation in G

Dealing with Ambiguity

Statistical model: weight steps in a derivation

- induces a partial ordering over derivations
- can be used to make a decision
 - e.g. best tree under the model

Probabilistic CFG

CFG extended with parameters $0 \leq \theta_r \leq 1$

- where $r \in \mathcal{R}$ and

$$\sum_{\alpha: X \rightarrow \alpha \in R} \theta_{X \rightarrow \alpha} = 1$$

Probabilistic CFG

Distribution over trees and their yields

$$\begin{aligned} P_{DS|NM}(R_1^m = r_1^m, X_1^n = \text{yield}(r_1^m) | n, m) \\ = \prod_{i=1}^m \theta_{r_i} = \prod_{i=1}^m \theta_{v_i \rightarrow \beta_i} \end{aligned}$$

where r_i corresponds to $v_i \rightarrow \beta_i$

Joint Distribution

${}_0S_3 \rightarrow {}_0NP_2 {}_2VP_3$

Complexity

Complexity

Item form: $[i, X \rightarrow \alpha \blacksquare \bullet \beta \square, j]$

Complexity

Item form: $[i, X \rightarrow \alpha \blacksquare \bullet \beta \square, j]$

- Each rule segments the input $x_1 \dots x_n$

Complexity

Item form: $[i, X \rightarrow \alpha \blacksquare \bullet \beta \square, j]$

- Each rule segments the input $x_1 \dots x_n$

Every CFG can be written in CNF (max arity = 2)

Complexity

Item form: $[i, X \rightarrow \alpha \blacksquare \bullet \beta \square, j]$

- Each rule segments the input $x_1 \dots x_n$

Every CFG can be written in CNF (max arity = 2)

- In total we get up to 3 indices ranging from 0 .. n

Complexity

Item form: $[i, X \rightarrow \alpha \blacksquare \bullet \beta \square, j]$

- Each rule segments the input $x_1 \dots x_n$

Every CFG can be written in CNF (max arity = 2)

- In total we get up to 3 indices ranging from 0 .. n
- $O(n^3)$ annotated rules
